Problem Statement Analysis

Managing complaints manually can be difficult and time-consuming. Users may not know the status of their complaints, while administrators may face difficulties in organizing, assigning, and tracking them.
The Smart Complaint Management System provides a centralized platform where users can submit and track complaints, while administrators can manage, assign, update, and resolve complaints efficiently.

Feasibility Testing

The Smart Complaint Management System is feasible because it can be developed using commonly available technologies and tools.

Technical Feasibility: The system can be developed using web technologies and a database such as MySQL.
Economic Feasibility: The project can be developed using mostly free and open-source tools, so the cost is low.
Operational Feasibility: The system will be simple to use for both users and administrators.
Schedule Feasibility: With a team of four members, the system can be developed and tested within the given project timeline.

Conclusion: The proposed system is technically, economically, operationally, and schedule feasible.
